

Transactions.

Write a function to delete user given userId. (user have added atleast one blog)

```
const { PrismaClient } = require("@prisma/client");
const prisma = new PrismaClient()

async function deleteUser(userId){
  const deletedUser = await prisma.user.delete({
    where: {
      id: userId
    },
  })
  return deletedUser;
}
deleteUser(1)
.then((user)=>{
  console.log("User deleted:",user);
})
```

this will throw an error, foreign key constraint - as user id is present in blog table.

There are multiple approach to handle this -

1. Transactions

```
const { PrismaClient } = require("@prisma/client");
const prisma = new PrismaClient();

async function deleteUser(userId) {
  // first delete all the blogs of a user
  const deleteBlogs = prisma.blog.deleteMany({
    where: {
      userId: userId,
    },
  },
```

```

    });
    // then delete user
    const deleteUser = prisma.user.delete({
      where: {
        id: userId,
      },
    });

    // Run both queries in a single transaction
    const transaction = await prisma.$transaction([deletePosts, deleteUser]);

    return transaction;
  }

  deleteUser(1)
    .then((result) => {
      console.log("Transaction complete:", result);
    })
    .catch((error) => {
      console.error("Transaction failed:", error);
    })

```

2. onDelete cascade property

in relation annotation in Blog model add one more property

```

model Blog {
  id          Int          @id @default(autoincrement())
  published   Boolean      @default(false)
  title       String       @db.VarChar(255)
  body        String
  createdAt   DateTime     @default(now())
  updatedAt   DateTime     @updatedAt
  userId      Int
  user        User         @relation(fields: [userId], references: [id], onDelete: Cascade)
}

```

onDelete cascade ensure that deleting a parent will delete all its child

Now the old code will work

```
const { PrismaClient } = require("@prisma/client");
const prisma = new PrismaClient()

async function deleteUser(userId){
  const deletedUser = await prisma.user.delete({
    where: {
      id: userId
    },
  })
  return deletedUser;
}
deleteUser(1)
.then((user)=>{
  console.log("User deleted:",user);
})
```
