

Why ORMs

1. Simple syntax (like oops)

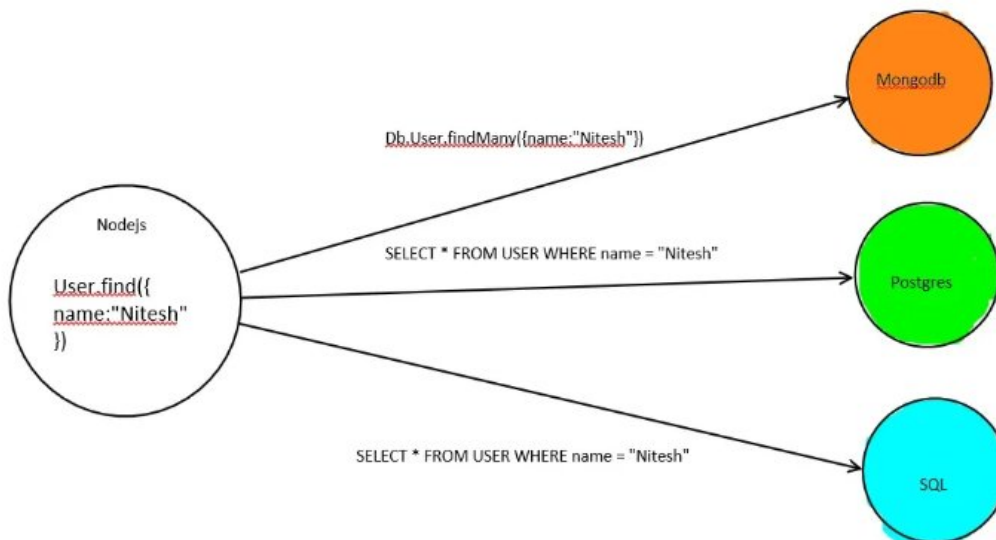

without orm

```
const query = `SELECT * FROM users WHERE name = $1`;
const values = ['Kartik'];
const result = await db.query(query, values);
```

with orm

```
User.find({
  name: 'Kartik'
})
```

2. Database Independence: Write one unified database logic , orm will convert it for whatever database you use.

Type safety/Auto completion : Ensures that variables and functions are used with the correct data types, reducing runtime errors.

The screenshot shows a code editor with a dark theme. On the left is a sidebar with icons for Explorer, Search, Source Control, Run and Debug, and Extensions. The main editor area shows a file named 'index.tsx' with the following code:

```
1 await prisma.user.findMany({
2   where: {
3     email: {
4       endsWith: '@prisma.io',
5     }
6   },
7   include: {
8     p
9   }
10 })
```

An auto-completion dropdown menu is open for the variable 'p' on line 8. It contains two items: 'posts' with the type 'Post[]' and 'profile' with the type 'Profile'.

SQL Injection Prevention: By using parameterized queries and input sanitization, ORMs help protect applications from SQL injection attacks

 What is prisma
