

Installing prisma in fresh new project

let create a simple blog application

1. Initialize a node project

```
npm init -y
```

JavaScript |  ...

2. Intsall dependency

```
npm insall prisma
```

3. Initialize prisma project

```
npx prisma init
```

- this will create a prisma folder where you can see schema.prisma file.

4. Next step

- Set the DATABASE_URL in your .env file to point to your database.
If your database is running locally the url will look something like this

```
//eg for postgres  
postgres://<USERNAME>:<PASSWORD>@localhost:<PORT>/<DB_NAME>  
//postgres://postgres:postgres@localhost:5432/blogApp
```

5. change client provider to prisma-client-js and remove output property. Choose your database provider.

Prisma lets you chose between a few databases (MySQL, Postgres, MongoDB)

```
prisma >  schema.prisma > ...  
1 // This is your Prisma schema file,  
2 // learn more about it in the docs: https://pris.ly/d/prisma-schema  
3
```

```

3
4  generator client {
5    | provider = "prisma-client-js"
6  }
7
8  datasource db {
9    | provider = "postgresql"
10   | url       = env("DATABASE_URL")
11 }
12

```

Install vs code extension prisma for better experience

6. Define data model

we are all ready to define our first model name User.

```

datasource db {
  provider = "postgresql"
  url      = env("DATABASE_URL")
}

generator client {
  provider = "prisma-client-js"
}

model User {
  id          Int      @id @default(autoincrement())
  email       String    @unique
  name        String?
  createdAt   DateTime @default(now())
}

```

```

//this is equivalent to sql query
CREATE TABLE "User" (
  id SERIAL PRIMARY KEY,
  email TEXT UNIQUE NOT NULL,
  name TEXT,
  "createdAt" TIMESTAMP NOT NULL DEFAULT NOW()
)

```

);
