

Migration

You have created a schema but this will not create a table inside your database, for this you have to run CREATE TABLE command.

Don't worry prisma will take care of this just run the following migration command

```
npx prisma migrate dev --name "created user schema"
```

migration let's you sync your schema and database.

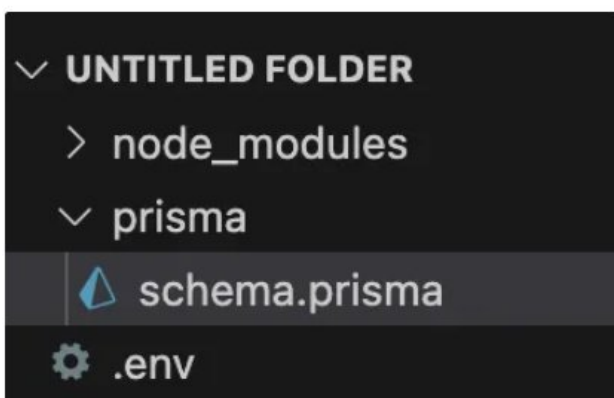

if it shows error

```
Failed to load config file "/Users/kartik/Desktop/untitled folder" as a
TypeScript/JavaScript module. Error: PrismaConfigEnvError: Missing required
environment variable: DATABASE_URL
```

then, install dotenv package

```
npm install dotenv
```

import dotenv package in prisma.config.ts file

```
import { defineConfig, env } from "prisma/config";
import "dotenv/config";

export default defineConfig({
  schema: "prisma/schema.prisma",
  migrations: {
    path: "prisma/migrations",
  },
  engine: "classic",
  datasource: {
    url: env("DATABASE_URL"),
  },
});
```

```
 .gitignore  
 package-lock.json  
 package.json  
 prisma.config.ts
```

Now run the migration command .
